How the Clipboard Hijack Works

When you clicked **"Copy"** in Attack Mode, this ran silently:

```
// What is shown on screen (looks legitimate)
const DISPLAYED_UPI = "amazon@axisbank";

// Attacker's UPI secretly written to clipboard
const ATTACKER_UPI  = "attacker@ybl";

function hijackCopy() {
  navigator.clipboard.writeText(ATTACKER_UPI); // silent swap!
  showAlert("Copied: " + DISPLAYED_UPI);        // fake confirm
}
```

Shown on screen:
amazon@axisbank

In your clipboard:
attacker@ybl

⚠ **Victim pastes in UPI app → money goes to attacker!**

4 Defences Implemented (Switch to Defence Mode)

Defence 1 — Clipboard Read-back
After copy, reads the clipboard and compares it to what was shown. Alerts immediately if mismatch detected.

Defence 2 — UPI Whitelist Validation
Checks UPI against a trusted merchant whitelist and validates format (name@bank). Rejects unknown handles.

Defence 3 — Visual Hash Fingerprint
Generates a short checksum (★☆★★ A3F7B2) of the UPI so users can verbally verify before paying.

Defence 4 — Paste Interception
Intercepts paste events on the payment field. Blocks and warns if a suspicious UPI is pasted.
